

## **MobiliFI**

MobiliFI is a framework developed by BPMLinks for Financial Institutions. The framework enables financial institutions to provide customers quick and secure access to their personal bank accounts. Customers can make transactions such as payments, transfers, deposits, view account balances / activity, and locate ATM / branch. It allows customers to login using biometric authentication such as FaceID, and TouchID. The Quick View Balance feature enables customers to view their account easily without logging into the application. Customers can capture images of the check and deposit it from anywhere and at anytime using a check scanner, thus avoiding a visit to the bank in person.

MobiliFI integrates with Zelle, a leading digital payments network, to send money to friends and family, and to receive from them as well. It offers additional features such as service requests, loans, offers, investments, shopping and travel. Customers can ask Siri or Google Assistant for account balances through voice command. MobiliFI also has companion Apple Watch and Android Wear apps.

MobiliFI enables financial institutions to offer a robust mobile platform to their customers, accelerate the development of Time to Market features, and help in customer acquisition / retention. This framework delivers mobile features, technology platform and strategic vision to delight the customers' digital banking experience with customer personalization, intuitive navigation, and easy to use features. The solution is available on iOS and Android.
